Abstract

The **Center for Holistic Integration (CHI)** at New York City College of Technology proposes an innovative initiative to advance responsible AI education at CUNY by integrating a prototype immersive blended classroom with a three-course AI curriculum arc. Grounded in the **Balanced Blended Space (BBS)** framework and powered by the Blended Reality Performance System (BRPS), this project enables students to engage directly with AI agents and mediated environments, exploring ethical and societal implications from within the same multimodal, machine-mediated conditions that define real-world AI systems. The initiative will develop and pilot three CUNY-ready OER courses—Introduction to AI, Collaborative AI, and Societal and Ethical Implications of Data Science (SEID) —while building a scalable model for AI literacy and experiential learning. Through cross-disciplinary collaboration and international partnership, the project aims to position City Tech as a leader in responsible AI pedagogy, fostering a community of practice and equipping students and faculty with the skills needed for the future of AI-integrated education.

1. Challenge Statement

Current instructional models in higher education focus on delivery formats—face-to-face, hybrid, online, and HyFlex—but are agnostic to the role of intelligence and mediation in learning environments. As a result, in these environments, students may explore AI ethics and literacy in theoretical settings that do not reflect the complex, multimodal, machine-mediated conditions of real-world AI systems. With AI capabilities evolving rapidly, there is a critical need for educational frameworks that allow students to engage with ethical, cognitive, and social challenges from within environments where human and computational intelligences interact directly. This initiative addresses that gap by developing an immersive blended classroom, enabling students and faculty to examine responsible AI in the same mediated conditions that define contemporary intelligent systems.

The central question guiding this project is:

How does learning about AI change when students engage directly with multimodal, machine-mediated environments—encountering not only ethical and social challenges, but also the practical, cognitive, and technical complexities of real-world AI systems?

2. Project Narrative

This proposal leverages the meta-project methodology of the **Center for Holistic Integration (CHI),** City Tech's designated interdisciplinary research center, to develop an innovative immersive **blended classroom** and three-courses in the AI curriculum arc. This integrated approach is grounded in the **Balanced Blended Space (BBS)** framework and powered by the **Blended Reality Performance System (BRPS)**, enabling students to engage directly with AI agents and mediated environments in a protected environment.

Unlike traditional instructional models that separate face-to-face, hybrid, and online modalities, the blended classroom unifies physical, virtual, and conceptual spaces with cognitive and computational intelligences. Students, faculty, and AI agents interact in real time, latent time, and indeterminate time, examining how intelligence, meaning, and responsibility shift across different domains. This environment transforms the classroom into a living laboratory, where mediation and collaboration are experienced rather than merely discussed.

The curriculum arc—comprising Introduction to AI, Collaborative AI, and SEID: Societal and Ethical Implications of Data Science—is designed to foster AI literacy and responsible use. Each course incorporates hands-on activities, case studies, and experiential learning within the blended classroom, allowing students to confront ethical, social, cognitive, and technical complexities of AI systems.

Collaboration is central to the project, with faculty, student researchers, and external partners contributing to curriculum development, classroom installation, and ongoing research. The initiative builds on existing CHI projects and international partnerships, ensuring a robust foundation for implementation and scalability.

By integrating innovative pedagogy, technical infrastructure, and cross-disciplinary collaboration, this project will help position City Tech as a leader in responsible AI education and provide a scalable model for adoption across CUNY.

2A. Theoretical Foundations

This initiative is built on three interrelated meta-projects developed by the Center for Holistic Integration (CHI):

- **Balanced Blended Space (BBS) Framework**:
  Provides a unified architecture for modeling human–machine communication across physical, virtual, and conceptual domains. Its Source–Vector–Destination–Domain schema reveals how meaning, agency, and responsibility shift through mediation, reframing AI as a collaborative participant in shared communicative flows.

- **Blended Reality Performance System (BRPS):**
  The technical implementation of BBS theory, BRPS enables real-time interaction and experimentation in a classroom that integrates physical and virtual elements.
- **Collaborative AI:**
  At the center of this initiative, Collaborative AI positions AI agents as active collaborators in learning environments. Students engage with both visible and embedded AI systems, mirroring real-world ecosystems where human and computational intelligences interact continuously.

Together, these foundations transform the classroom into a living laboratory for responsible AI education, supporting hands-on exploration of ethical, social, cognitive, and technical dimensions.

2B. Blended Classroom Description (Climax Version)

The immersive blended classroom is a tightly integrated, highly mediated environment, designed according to the Balanced Blended Space (BBS) framework. Physical space is equipped with gesture trackers, cameras, biosensors, spatial audio, projectors, dynamic lighting, and embedded computational hardware. These devices form the physical infrastructure for mediation—capturing, transmitting, and rendering signals between domains. Personal devices are fully integrated, enabling both local and remote participation.

A symmetrical virtual component complements the physical classroom—not as a literal twin, but as an interoperable environment configured to align with the physical space. Remote participants and virtual agents interact through overlays, spatial audio, and AI-driven media. AI agents are software entities embedded in the virtual domain; they interpret and respond to signals, influencing the physical classroom via mediated cues such as projections, sound, and interactive media.

Mediation technologies continuously transport and transform information, agency, and meaning across physical, virtual, and conceptual domains. Remote humans transmit their presence through the virtual environment, which is mapped and injected into the physical classroom—just as virtual agents and cloud-based entities travel through virtual space and are rendered into the physical environment for meaningful collaboration. This bidirectional mapping ensures that all participants—human and AI, local and remote—can co-create meaning and negotiate agency in real time.

At the core is conceptual space, where collaboration and ethical reasoning emerge, supported by the integration of all mediation technologies. Unlike traditional models, AI and mediation are foundational, not supplemental, making the classroom a living laboratory for responsible, multi-modal learning.

Unlike other systems such as HyFlex, which focuses on access across spaces, the Blended Classroom centers on mediated intelligence—examining how meaning and agency shift across physical, virtual, and conceptual domains. Its uniqueness lies in the continuous integration of human cognition and computational agency, making mediation and collaboration foundational to the learning experience rather than optional or supplemental.

2C. Example Use Case of a fully implemented Blended Classroom

This example activity illustrates the depth and potential of a fully developed Balanced Blended Classroom for responsible AI education. It shows how integrated, interactive environments enable complex learning experiences—combining physical and virtual participation, multiple stakeholder roles, and AI-driven mediation. While full development is beyond this grant's scope, the proposed work focuses on essential infrastructure and interactive elements that future efforts will build upon. The requested equipment is vital for testing and delivering these activities and will be leveraged alongside other grants and ongoing projects for sustained development.

Use Case: Algorithmic Fairness & Mediated Responsibility in College Applications

This lesson immerses students in the ethical and practical challenges of algorithmic fairness through a simulated college application screening. Students participate both remotely and in the physical classroom, engaging synchronously and asynchronously for inclusive, persistent learning. Each participant may assume multiple stakeholder roles—such as applicant advocate, selection committee member, or policy officer—across different phases, with roles distributed before, during, and after the live session

Preparation begins in a virtual environment, where students build "role readiness" via guided modules, stakeholder mapping, ethical reflection, and review of real-world cases of bias and abuse. All data is simulated and anonymized, with explicit privacy assurances for FERPA compliance. Optional serious-game rehearsals allow students to practice roles and test fairness prompts.

During the live session, the Blended Classroom is orchestrated by the instructor and a suite of AI agents—including Fairness Monitor, Socratic Agent, Identity-Verification Checker, Simulated Applicants, Bias Auditor, Analytical Feedback Agent, Avatar Recapitulation Agent, and Instructor Dashboard Agent. Students interact with human and AI agents, collaboratively analyzing the AI-driven selection model and observing how parameter changes affect fairness. Signals and agency are mediated across physical, virtual, and conceptual domains, making ethical reasoning an embodied, real-time experience. Students must clearly state their ethical frameworks and rationales for key interventions to ensure accountability and allow critique.

Non-synchronous participation is fully integrated: students joining outside the scheduled window interact with avatar cohorts that replay and extend debates using captured data

from the synchronous activities. Agent-led replays allow participants to revisit pivotal moments, while analytical agents synthesize ethical reasoning and provide personalized feedback. Instructor dashboards identify areas needing reinforcement, supporting curriculum refinement. Serious-game extensions challenge students to document ethical rationales and stakeholder impacts in "what-if" scenarios. Reports of these activities are sent to the instructor for further feedback and evaluation.

All applicant data and classroom telemetry are simulated, anonymized, and locally stored under institutional controls, maintaining strict privacy and FERPA compliance. This integrated approach enables students to experience fairness as a lived practice, negotiate responsibility among human and AI agents, and develop practical skills in ethical instrumentation and professional integrity. The blended classroom ensures all participants—regardless of when or how they join—can co-create meaning, negotiate responsibility, and build competencies for responsible AI use

3. Collaboration and Alignment

This initiative is fundamentally collaborative in both design and implementation. It is built on the Center for Holistic Integration (CHI), whose meta-project structure already supports coordinated work across disciplines, modalities, and intelligences. CHI's model of shared research infrastructure—spanning human faculties, student researchers, and embedded AI systems—provides the operational foundation for developing, testing, and refining the blended classroom.

The project engages a broad coalition of collaborators across City Tech, including **Entertainment Technology, Emerging Media Technology, Computer Systems Technology, Computer Engineering Technology, Humanities, Communication Design,** and **Business**. Collaboration extends beyond the campus through partners such as **Gamelan Yowana Sari (Queens College)**, **Worcester Polytechnic University, the Autonomous Vehicle Mobility Institute,** and **Modul University Vienna**. Student researchers participate directly in research, installation, calibration, documentation, and AI development, while AI agents—personalized local LLMs, multimodal analysis systems, and BRPS-integrated controllers—participate as collaborators.

Together, these partners form a distributed, multi-intelligence team whose shared ownership and joint implementation strategy fully satisfies OAA's review Criterion 3 expectations for cross-functional collaboration.
(Full collaborator and meta-project details appear in **Appendix A** and **Appendix B**.)

4. Project Activities

To transform the blended classroom from proof-of-concept into a functioning instructional and research environment, the project undertakes a coordinated set of activities that integrate installation, curriculum development, and cross-institutional dissemination.

These activities build on one another: the immersive environment enables the curriculum, the curriculum generates the OER materials, and both feed into workshops and long-term adoption.

- **Blended Environment Installation & Integration:** Purchase and install projectors, cameras, sensors, mounts, and computational hardware. Configure projection fabrics, computer vision systems, and room self-awareness functions. Integrate BRPS synchronization and multimodal pipelines.
- **Coordination with CHI Initiatives:** Integrate AVMI sonic immersion, BSPT projection systems, BABS biosensing, and Collaborative AI LLM pipelines into the blended classroom, ensuring interoperability and multi-agent responsiveness.
- **Pilot Delivery at Modul University (Feb–June 2026):** Deliver SEID 2364 in a blended configuration; gather qualitative and quantitative feedback; analyze student engagement with mediated pathways.
- **Curriculum Arc Development:** Advance *Introduction to AI* and *Collaborative AI* as stand-alone CUNY courses. Align assessment strategies with BBS-mediated learning.
- **OER Package Creation:** Develop slides, assignments, diagrams, case studies, mediation pathway analyses, and video modules. Ensure materials are adaptable across CUNY.
- **Delivery of CUNY OAA expectations:** reports, participation in CUNY events, or website deployment.

5. Expected Outcomes

1. **A fully developed, CUNY-ready OER ethics course** (SEID 2364) with complete instructional modules, assignments, diagrams, and media assets.
2. **Significant progress toward two additional AI courses**—*Introduction to AI* and *Collaborative AI*—including draft syllabi, assessment structures, and sample activities.
3. **A functioning prototype immersive blended classroom**, capable of synchronizing physical, virtual, cognitive, and computational agents and supporting research-based evaluation.
4. **Increased AI literacy among City Tech students and faculty**, with applied understanding of mediated communication and responsible AI.
5. **A cross-campus community of practice**, supported through workshops and shared materials.

6. Impact and Broader Significance

This project investigates a new model of AI education in CUNY—one that treats mediated environments not as delivery challenges but as **objects of inquiry**. By situating students inside a multimodal, multi-agent ecosystem, the blended classroom enables them to analyze fairness, accountability, transparency, bias, embodied interaction, and AI collaboration through direct experience.

- **City Tech becomes a leader in responsible AI pedagogy**, with a research-grade facility capable of supporting interdisciplinary grants.
- The project seeds long-term integration of blended environments into **STEM, arts, humanities, and design**.
- The experimental classroom becomes a hub for **CUNY-wide workshops**, demonstrating scalable applications of BBS-based mediation analysis.
- The personalized LLMs developed for this effort provide a model for **privacy-preserving AI in higher education**, addressing institutional concerns about data governance.

Because the blended classroom is built on existing CHI initiatives, the project generates **institutional leverage**, multiplying the impact of past investments and scaffolding future research.

7. Priority Alignment (Areas 1, 2, and 4)

This initiative aligns strongly with three of the four OAA Priority Areas. It advances AI literacy and responsible use (Priority 1), integrates AI into new and existing courses through an immersive, mediated environment (Priority 2), and—most substantially—addresses the ethical and societal implications of AI through experiential BBS-informed learning (Priority 4). A detailed mapping of activities to OAA priorities is provided in **Appendix C: Priority Alignment Matrix**.

8. Project Timeline

Phase	Activities	Timeline
I. Environment Installation & BRPS Integration	Purchase and install projectors, cameras, sensors, mounts; configure projection fabric, computer vision, audio capture; develop room self-awareness functions (sensing, tracking, computational monitoring); initial BRPS synchronization; iterative testing with student researchers; integration of AVMI, BSPT, BABS, personalized LLM systems, and AI-mediated media control pipelines.	Jan–Mar 2026

Phase	Activities	Timeline
II. Modul Pilot Delivery & Curriculum Refinement	Deliver SEID 2364 pilot at Modul (Feb–June 2026); gather feedback; revise modules; integrate findings into OER and CUNY course design.	Feb–June 2026
III. OER Development (Ongoing)	Create slides, assignments, BBS diagrams, video modules; integrate insights from blended environment.	Feb–June 2026
IV. Faculty & Resource Workshops	Demonstrations of blended environment; faculty development across City Tech and CUNY.	Apr–May 2026
V. Publication and Dissemination	CUNY Academic Works release; cross-campus dissemination; final assessment report.	June 2026

9. Budget Overview & Allowable Costs

The requested $25,000 supports essential instructional technology, prototype hardware, licensed AI tools, and student personnel for the AI-mediated immersive blended classroom. All requested items are non-capital, individually under $5,000, and fully compliant with OAA and NYS guidelines.

Breakdown of the $25,000 Request

(All items are non-capital; values to be adjusted once pricing is confirmed.)

1. **Prototype Hardware for BBS/BRPS Structural Frame – $7,000**
   - T-slot 8020 aluminum hardware (reconfigurable frame).
   - Brackets, joiners, supports, and assembly components.
   - Mounting hardware for sensors and projectors.
2. **Projection & Computer-Vision Systems – $7,000**
   - Short-throw projectors (< $2,000 each).
   - Computer-vision cameras and depth sensors.
   - Projector mounts and interchangeable lens components.
3. **Sensors, Microcontrollers & Embedded Devices – $4,500**
   - Environmental and motion/gesture sensors.
   - Microcontrollers and interface boards.
   - Embedded processors for rapid prototyping.
4. **Licensed AI Software & Tools – $2,000**
   - Multi-agent collaborative AI platforms.
   - Ethical-AI/bias-detection tools.

- Vision-processing and mediation-mapping software.

5. **Student Personnel Support – $3,500**
    - Undergraduate research assistants for configuration, documentation, testing, and blended-classroom integration.
    - Supports approximately 170–185 student work hours at CUNY hourly rates.

Timeline & Feasibility

- All funds encumbered and expended by June 30, 2026.
- No prohibited categories (travel, marketing, permanent installations, capital equipment) are included.
- Feasibility is strengthened by existing GRTI/AVMI infrastructure and a functioning BRPS/BBS test environment.

Existing Infrastructure Already Funded (GRTI & AVMI)

- GRTI-funded: projection fabrics, scrims, blended-surface materials.
- AVMI-funded (U.S. Congressional Appropriation via U.S. Army GVSC): high-fidelity spatial audio, sensing, and simulation infrastructure supporting immersive military training research; City Tech is a subrecipient under WPI's GVSC10-2024 award.
- These investments allow OAA funds to focus exclusively on AI-specific instructional innovation.
- Additional Institutional Support (Non-OAA): Dr. Smith's participation is partially underwritten through CHI leadership responsibilities, the Modul University Vienna ethics pilot, and other funded initiatives. Additional student work will occur through Emerging Scholars, Culmination Projects, Internships, and FWS placements.

Compliance Summary

- All hardware is non-capital (< $5,000 per item).
- All expenditures directly support AI literacy and responsible AI integration.
- Software is licensable within the fiscal year.
- Budget fully aligns with OAA allowable cost categories.

10. Conclusion

The Integrated AI Ethics and Immersive Blended Learning Initiative places City Tech at the forefront of responsible AI education. By merging CHI research strands into a unified, research-grade blended classroom, the project advances pedagogy, infrastructure, and scholarship. Students will engage with AI ethics through direct, multimodal experiences that reflect real-world systems.

This initiative enhances interdisciplinary research, expands CUNY's AI curriculum, and creates a scalable model for future innovation. With existing CHI infrastructure, OAA funding will accelerate the integration of Meta-Projects into a functional instructional environment, turning conceptual connections into operational classroom practice.

Rather than aiming to "complete" the Blended Classroom in this cycle, the focus is on integrating current CHI Meta-Projects and building the foundational infrastructure for a unified learning environment. By semester's end, a working instructional platform will connect existing CHI Meta-projects, research and support ongoing development.

Appendix A: Collaborators and Partners

PI: Dr. David B. Smith — Qualifications and Role

Dr. David B. Smith, Professor of Entertainment Technology and Artistic Director of the Center for Holistic Integration (CHI), and Dean Emeritus of the School of Professional Studies, serves as the Principal Investigator. Dr. Smith has over thirty-five years of experience developing interactive media systems, AI-enhanced performance technologies, and multimodal learning environments. He has an extensive track record in curriculum and program development at City Tech, having created or co-created multiple academic degrees—including **Emerging Media Technology**, **Business & Technology of Fashion**, **AS in Health Science**, and **BS in Healthcare Policy and Management**—as well as numerous interdisciplinary courses that bridge technology, design, and the humanities.

Dr. Smith leads several major CHI research initiatives foundational to this proposal, including the Blended Shadow Puppet Theatre (BSPT), Bio-Aware Blended Space (BABS), Autonomous Vehicle Mobility Institute (AVMI) immersive audio environment, and the Collaborative AI Meta-Project. His international collaboration with Modul University Vienna, where SEID 2364 will be piloted, further supports the project's academic validity and cross-institutional continuity. His background in integrating cognitive and computational intelligence into creative and pedagogical systems ensures the conceptual, technical, and administrative capacity required to execute the proposed immersive blended classroom and AI curriculum arc.

Collaborating Faculty and CHI Fellows (Selected)

- Dr. Ann Delilkan — Humanities; CHI Co-Director
- Dr. Christopher Swift — Humanities; BSPT / performance research
- Prof. Benjamin Mendoza — Computer Engineering Technology (CET)
- Prof. Anita Giraldo — Communication Design (COMD)
- Prof. Nazanin Munroe — Business (BUS)
- Prof. Frederick Bianchi — Interactive Media & Neuroscience, Worcester Polytechnic Institute
- Prof. Lori McCann — Music, Montclair State University

Collaborating Departments (City Tech)

- Entertainment Technology (ENT)
- Emerging Media Technology (EMT)
- Computer Systems Technology (CST)
- Computer Engineering Technology (CET)
- Humanities (ENG/PHIL)
- Communication Design (COMD)

- Business and Technology of Fashion (BUF)

CUNY System Collaborators

- Gamelan Yowana Sari (Queens College)
- CUNY AI Innovation & Technology Fellows

International Partner

- Modul University Vienna (SEID pilot site)

Computational Collaborators: Roles and Personalities

Just as human teams benefit from a diversity of roles and personalities, so too will the collaborative teams in our blended classroom—composed of both students and AI agents. We recognize that the roster of computational collaborators will evolve as technology advances and as new instructional needs arise. Therefore, we organize AI collaborators along two dimensions: **Agent Roles** (the functions they perform) and **Agent Personalities** (the interaction styles or "flavors" they exhibit).

Agent Roles (What AI Agents Do)

AI agents can be designed or selected to fulfill a variety of roles within the learning environment, including but not limited to:

- **Conversational and Tutoring Agents:**
  Facilitate dialogue, answer questions, provide explanations, and support brainstorming or tutoring.
- **Analytical and Assessment Agents:**
  Analyze student work, classroom data, or system logs; provide feedback, grading, or formative assessment.
- **Multimodal Analysis Pipelines:**
  Integrate and interpret data from multiple sources (text, audio, video, sensors) to provide real-time insights, adaptive feedback, and context-aware support. These agents can recognize gestures, track engagement, correlate spoken input with visual or sensor data, and help instructors understand classroom dynamics.
- **Media and Environment Controllers:**
  Manage and synchronize media (audio, video, projections) across physical and virtual spaces; adjust lighting, sound, or display based on activity.
- **Sensing and Monitoring Agents:**
  Monitor environmental conditions, participant presence, or physiological signals; trigger interventions or alerts.

- **Simulation and Scenario Agents:**
  Simulate real-world scenarios, act as virtual participants, or run "what-if" experiments for ethical, technical, or collaborative learning.
- **Ethics and Fairness Auditors:**
  Monitor for bias, fairness, and ethical compliance in AI-driven processes or classroom activities.
- **Personalized Local LLMs:**
  Provide privacy-preserving, context-aware support tailored to institutional or classroom needs.

Agent Personalities (How AI Agents Interact)

Beyond their roles, AI agents can be configured or selected for different "personalities"—interaction styles that shape how they communicate, collaborate, and support learning. For example:

- **Socratic:** Probes with questions to stimulate critical thinking.
- **Supportive:** Offers encouragement and positive reinforcement.
- **Analytical:** Focuses on data-driven insights and logical reasoning.
- **Creative:** Suggests novel ideas and alternative approaches.
- **Skeptical:** Challenges assumptions and prompts deeper reflection.
- **Concise vs. Expansive:** Some agents may provide brief, direct answers; others may elaborate or offer context.

These personalities can be embodied in both general-purpose agents (such as large language models) and custom-designed classroom agents. Importantly, the same underlying AI (e.g., a language model) can be instantiated with different personalities to suit different collaborative needs.

Evolving Collaboration

We acknowledge that, just as we cannot predict all future student collaborators, we cannot fully anticipate every AI agent or personality that will participate in the classroom. The list of computational collaborators is intentionally open and evolving. As new AI agents and tools become available, students and course designers are encouraged to select, adapt, or develop collaborators that best fit their instructional and research needs—mirroring the diversity and dynamism of human collaboration.

Appendix B: CHI Meta-Projects

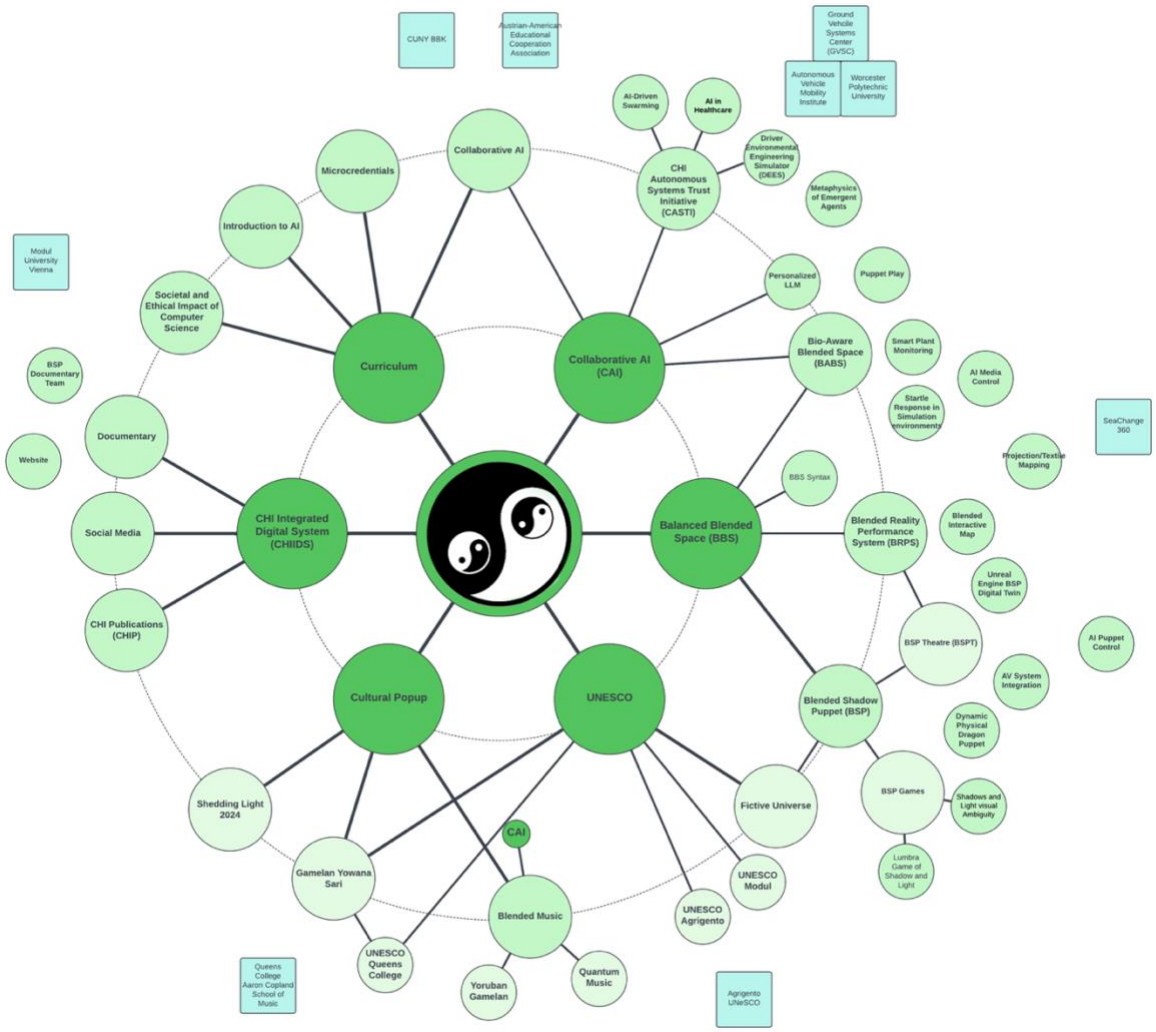

CHI hosts numerous multiple Meta-Projects. The most deeply aligned with the Blended Classroom are listed below. The spectrum of current CHI Meta-pjects and their offspring is pictured below.

Autonomous Vehicle Mobility Institute (AVMI) — Spatialized audio, formation-based interaction, multimodal sensing.

Blended Shadow Puppet Theatre (BSPT) — Projection systems, blended visual environments, real-time media control.

Bio-Aware Blended Space (BABS) — Biosensing, computer vision, affect-augmented mediation.

Collaborative (CAI) — Personalized LLMs, multi-agent structures, responsible AI interaction.

Appendix C: OAA Priority Alignment

This project aligns strongly with **Priority Areas 1, 2, and 4** of the CUNY OAA AI Innovation Fund. Each priority area now includes a brief narrative summary explicitly linking the curriculum arc and the immersive blended classroom to the priority's intent, followed by concise bullet points.

Priority Area 1 — AI Education & Literacy

Foundational AI literacy is advanced through two new OER-based CUNY courses—Introduction to AI and Collaborative AI—and the refinement of SEID 2364. These courses provide conceptual, technical, and ethical foundations in AI, enriched by hands-on engagement with AI-mediated environments in the blended classroom.

- Development of Introduction to AI and Collaborative AI as CUNY-ready OER courses.
- Integration of AI tools into SEID 2364: Societal and Ethical Implications of Data Science.
- Direct student engagement with AI agents and mediated environments.

Priority Area 2 — AI in Courses

The three-course curriculum arc—Introduction to AI, Collaborative AI, and SEID 2364—deeply integrates AI into course design, activities, and assessment. The blended classroom serves as the testbed for implementing and evaluating these AI-mediated components, ensuring authentic, experiential learning.

- AI-rich three-course curriculum arc.
- AI-mediated assignments, including BBS pathway diagrams.
- Use of visible and invisible AI collaborators in the classroom.

Priority Area 4 — Ethical & Social Implications of AI

SEID is a dedicated ethics course examining fairness, bias, transparency, accountability, and governance within the multimodal, multi-agent blended environment. Students analyze how mediation influences ethical judgment, confronting real-world complexities of AI systems.

- SEID addresses all Priority 4 elements through experiential BBS-informed analysis.
- Students assess how mediation across spaces, modalities, and time affects ethical perception.
